

Anhuang Afforestation Project

Afforestation in 3 counties of Guizhou Province:
Huangping, Wengan and Anlong

Location	Guizhou Province China
Primary certification standard	Verified Carbon Standard
Add. certifications	Climate, Community and Biodiversity Standard
Project size	39.000 ha
Project start	15 th March 2016

ABOUT THIS PROJECT

The ecosystem which was build in the last 5 years helped to mitigate process of rocky desertification in the region. Trees were planted on area of total **39.000 ha** during the years 2016/2017. For the afforestation **3 native species** of trees were selected: China fir, Masson pine and Cypress.

Before the Anhuang project there was no plans to afforest the region and the **lands would remain barren**. Without the project the **soil erosion** would continue due to **intense exploitation by human activities** (mainly intense farming and resource collecting). Proceeding erosion is endangering many species of plants and animals in the region including **François' langurs** which are endangered with only c.a. **2.000 individuals left in the wild**.
